Edus — Tenant Acceptance Test

Scope: the school, not the platform. This document tests what happens *inside* a school (tenant). Creating the school, subscriptions, plans and billing belong to the landlord and are out of scope — you are given a tenant that already exists.

How to use it: work top to bottom, fill in the Observed column as you go (`OK`, or what you actually saw), and use Observer notes for one thing only: the user's own experience of anything that differed from *Expected* — wording that confused, an action you could not find, a message that said the wrong thing. The observer is the agent sitting beside the user, not the person clicking.

> Do not fix anything mid-run. Write it down and carry on. A run that stops at step 20 has tested less than one that finishes with thirty observations.
>
> The order is deliberate. Each section only uses things created in the sections above it. If you find yourself needing something that does not exist yet, that is a finding — note it, do not jump ahead and come back.

---

1. The stakeholders — read this before you start

These are the five people the school actually employs or serves. The school's own staff come first, because nothing in the platform works until they have set it up: every other actor — and every number a parent eventually sees — is downstream of them. A parent cannot register, apply, pay or read a result until an admin has built the academic year and a bursar has loaded the pupils.

#	Actor	Role in the system	What they must be able to do unaided	What breaks if they cannot
A	School Admin (proprietor/principal)	`ROLE_ADMIN`	Configure the school, the academic year, classes, subjects, fees and staff	Nothing else can happen. Every later section depends on this one
B	Bursar	`ROLE_BURSAR`	Load pupils in bulk or one at a time, admit applicants, take and reconcile money	The school cannot enrol, bill, or prove anyone paid
C	Teacher	`ROLE_TEACHER`	Enter, save and submit CA and exam scores for their own classes only	There are no results to report
D	Form teacher / HOD / Year-group master	usually also `ROLE_TEACHER`	Confirm and approve results through three stages	Results are never released, or leak unreviewed

#	Actor	Role in the system	What they must be able to do unaided	What breaks if they cannot
E	Parent	`ROLE_PARENT`	Register, apply for a child, pay, and read the result	The school's work produces no value — this is the audience

The golden rule this ordering protects: *staff first, parent last.* The parent is the customer but the last link in the chain; every acceptance run must prove that a parent never has to ask the school to "do something" that the school could have done earlier.

Deliberately out of scope: the landlord/super-admin, subscription and plan billing, agent/agency flows, SMS to parents (no SMS provider is wired up), and the public marketing website.

---

2. Before you start

Item	Notes
Tenant URL	e.g. `http://greenfield.localhost:8082`
School admin login	given to you
`docs/testing/sample-students.csv`	8 pupils, 13 columns — the bulk-import file
Two email addresses	one for a parent account; one you can open to read mail
~40 minutes	sections 3–7 alone are the core

Sign in at `<tenant>/login`. Everything below happens on the tenant host — if you find yourself on a page without the school's name in the header, you are on the wrong host.

---

3. Actor A — School Admin sets the school up

Signed in as: school admin.

#	Do this	Expected	Observed	Observer notes
3.1	Open `/dashboard/settings` and fill in the school's phone, address and motto. Save	"School website settings saved successfully."		

#	Do this	Expected	Observed	Observer notes
3.2	Check the sidebar	Grouped sections — Admissions, Administration, Finance, Teaching, Reports — with a filter box at the top. Every item is reachable		
3.3	Administration ? Sessions & Terms	One session with three terms; exactly one term is marked active		
3.4	Administration ? Classes	The classes you need exist (`JSS 1A` , `JSS 1B` , `JSS 2A` , `JSS 3C`)		
3.5	Administration ? Subjects	At least one subject exists (`Mathematics`)		
3.6	Administration ? Grading Scale	Grade bands with min/max (e.g. A1 = 70–100). Add one if the list is empty		
3.7	Administration ? Class Subjects	Every class has its subjects linked and a subject teacher assigned		
3.8	Finance ? Fee Items, then Fee Structures	At least one non-optional fee item priced for each class in the active term		
3.9	Administration ? Staff	A staff record exists for the bursar and for at least one teacher, each with a working login		
3.10	Administration ? Departments / Year Groups (if shown)	Heads and year-group masters are assigned		

> ?? The most common reason a later section looks broken is step 3.8: a class with no fee structure for the active term. Pupils are still admitted, but no invoice is raised, and section 7 has nothing to pay. Confirm 3.8 before continuing.

---

4. Actor B — Bursar loads the existing pupils

Signed in as: bursar (`ROLE_BURSAR`).

#	Do this	Expected	Observed	Observer notes
4.1	Admissions ? Bulk Import (`/quick-enroll/`)	An upload page with a Download Template link		

#	Do this	Expected	Observed	Observer notes
4.2	Download the template and open it	13 columns, in this order: First Name, Middle Name, Last Name, Gender (M/F), DOB (YYYY-MM-DD), Religion, Blood Group, Genotype, Home Town, Admission Number (Leave blank to auto-generate), Class Name, Parent Name, Parent Phone		
4.3	Compare it with `sample-students.csv`	Identical columns and order — you may use the sample file directly		
4.4	Select the active term, choose the CSV, upload	A result stating 8 imported — not 0		
4.5	Admissions ? Students	8 pupils, each with an auto-generated `ADM/<year>/####` number		
4.6	Open one pupil	Guardian name and phone from the CSV are attached		
4.7	Finance ? Invoices	8 invoices, one per pupil, line items summing to the class fee		
4.8	Re-upload the same file	Reports 0 new rows — no duplicates		
4.9	Admissions ? New Admission and admit one pupil by hand	The same admission engine runs: admission number, enrollment and invoice appear		

Watch for: a run reporting 0 imported almost always means the term dropdown was left on its placeholder ("Select Term…"), which silently rejects every row.

---

5. Actor E — Parent registers and applies

Use a second email address, in a private window so the staff session survives.

#	Do this	Expected	Observed	Observer notes
5.1	Open `<tenant>/apply`	The public admissions page — no login needed		
5.2	Register as a parent	Form for name, email, phone, password		
5.3	Try the password `password123` first	Rejected with a clear "too easy to guess" message		

#	Do this	Expected	Observed	Observer notes
5.4	Register with a strong password (e.g. `GreenField!2026`)	Account created; a confirmation email is sent		
5.5	Open the confirmation email	Arrives from the school's own name. *(Dev: `http://localhost:8025`. With Brevo configured, a real inbox)*		
5.6	Sign in as the parent	Parent dashboard		
5.7	+ Apply for a child	Multi-step application form		
5.8	Complete every step for a child, choosing class `JSS 1A`, then submit	A reference `APP/<year>/0001`; the application shows as Submitted		
5.9	Check the inbox again	Acknowledgement email naming the reference		

---

6. Actor B — Bursar reviews and admits the application

Back as the bursar (or admin — the queue accepts both).

#	Do this	Expected	Observed	Observer notes
6.1	Admissions ? Applications (`/admission/applications`)	The queue lists the application, with counters (needs attention / new / under review / needs info / enrolled / rejected)		
6.2	Open it	Child, guardian, documents, history and a Decision panel		
6.3	Look at the status badge	Moved from *Submitted* to *Under review*, with a history entry naming you		
6.4	Press Send back to parent with no reason	Refused — a reason is required, because the parent reads it		
6.5	Press Approve & enrol	Green confirmation naming the new admission number; banner becomes Enrolled		
6.6	Admissions ? Students	The new pupil, correct class, `ADM/<year>/####`		
6.7	Finance ? Invoices	A new invoice with line items		

#	Do this	Expected	Observed	Observer notes
6.8	Apply for a second child from the same parent (repeat 5.7–5.8), then admit it	The existing guardian is reused — the parent list does not gain a duplicate		

---

7. Actors E and B — Money, both ways

7a. Offline transfer

#	Do this	Expected	Observed	Observer notes
7.1	As the parent, open Fees & Payments	The outstanding invoice and its balance		
7.2	Open the invoice ? Generate Payment Slip	A slip with a reference, the amount, and the school's real bank name and account number		
7.3	Read the bank details	Real values. `0000000000` / Bank Not Set means school setup is incomplete — record it, a parent cannot pay against it		
7.4	As the bursar, open Finance ? Payments ? the pupil's terminal	The pending transfer is listed		
7.5	Confirm it	Invoice becomes PAID, balance zero, receipt email sent to the parent		
7.6	Try to confirm the same slip twice	Refused with "already fully paid" — and the slip is cancelled, not silently re-added		

7b. Online payment

#	Do this	Expected	Observed	Observer notes
7.7	As the admin, set Payment method to `Both` or `Online` in `/dashboard/settings`. Save	Saved		
7.8	Back as the parent, open Fees & Payments	A Pay online button now appears		

#	Do this	Expected	Observed	Observer notes
7.9	Press it	The real gateway page, or a simulated checkout explaining that no gateway key is configured		
7.10	Press Simulate successful payment	"Payment received", a `PAY-<year>-XXXXXX` reference, fees and a processing charge shown separately		
7.11	Check the inbox	A "Payment received" receipt email		
7.12	As the bursar, open the pupil's terminal	Invoice PAID; the payment recorded as `ONLINE` / `CONFIRMED`		
7.13	Repeat 7.8–7.10 and choose Simulate a decline	The invoice stays unpaid and the parent is told it failed		

Watch for: the processing charge is added on top and capped. The school must still receive the full fee — check the school's figure, not the parent's total.

---

8. Actor C — Teacher enters and submits scores

Signed in as: teacher.

#	Do this	Expected	Observed	Observer notes
8.1	Look at the sidebar	Only Teaching and Reports items. No Finance, no Administration		
8.2	Teaching ? Result Entry, pick the class and subject	A table of the class's pupils with CA1 / CA2 / CA3 / Theory columns		
8.3	Type a score into a few rows	Total and Grade update live as you type		
8.4	Press Save All Scores, then reload the page	"Scores saved." — and the scores are still there after the reload		
8.5	Enter an impossible score (e.g. 999)	Refused, or capped — never silently accepted		
8.6	Try to open another teacher's class by editing the URL	Access denied		
8.7	Press Submit for Approval	Page reloads with a padlock: results submitted and locked		
8.8	Try to edit a score after submitting	Inputs are disabled		

> Why 8.4 insists on a reload: the save is asynchronous. A page that says "Scores saved." while the request actually failed is the most damaging bug this system can have, because the teacher has no reason to doubt it.

---

9. Actor D — Three-stage approval

Still as staff. The three stages exist so no single person can release results alone.

#	Do this	Expected	Observed	Observer notes
9.1	Open Approvals (`/tenant/approvals`)	Three clearly separated stages: Form Teacher — Confirm Classes, HOD — Approve Department Subjects, Year Group Master — Final Approval		
9.2	Stage 1: confirm the class	Success; the subject shows as confirmed		
9.3	Stage 2: approve as HOD	Success		
9.4	Stage 3: final-approve as year-group master	Success		
9.5	Press Final Approve again	Disabled or refused — a second press must not change anything		
9.6	Go back to Result Entry for that subject	Still locked; editing requires an explicit unlock		
9.7	Unlock it, then re-approve	The unlock is recorded, and re-approval works		

---

10. Actor E — Parent reads the result

#	Do this	Expected	Observed	Observer notes
10.1	As the parent, open My Results	The subject, total and grade for the term		

#	Do this	Expected	Observed	Observer notes
10.2	Judge it as a parent would	Can you answer, without clicking anything else: *what did my child get, and is that good?*		
10.3	Compare with the class broadsheet (staff ? Reports ? form teacher)	The parent's figures match the school's		
10.4	Try to open another pupil's result by changing the id in the URL	Access denied		

> This step is the whole product. Score the answer to 10.2 honestly — it is the input to `docs/results/RESULT-CARD-DESIGN.md` .

---

11. Every actor — mobile

Parents use this on a phone, one-handed, on a slow connection. Use the device toolbar.

#	Do this	Expected	Observed	Observer notes
11.1	360px: parent dashboard	One column, nothing cut off, no sideways scrolling		
11.2	360px: Fees & Payments	Readable; wide tables scroll inside their box, not the page		
11.3	360px: staff Applications queue	Each application is a card, not a squeezed table		
11.4	360px: Result Entry	Usable — a teacher must be able to enter scores on a phone		
11.5	Tap every primary action	Comfortably tappable, nothing under a fingertip		
11.6	Tap a text field	The page must not zoom in (that means the field is under 16px)		
11.7	Repeat 11.1–11.4 at 1024px	Layout widens sensibly; still no sideways scrolling		

---

12. Sign-off

Question	Answer
Tenant / subdomain tested	
Date and time	
Tester (the person clicking)	
Observer (the agent recording differences)	
Steps completed (of 63)	
Steps that failed outright	
Most confusing moment of the run	
Could the admin set the school up alone?	
Could the bursar import and admit alone?	
Could the teacher enter and submit alone?	
Could the parent register, pay and read the result alone?	
Overall: ready / ready with caveats / not ready	

---

13. Known rough edges — confirm or clear

Found on a live tenant run. Treat these as *things to check*, not as a script: if the behaviour has changed, record that rather than assuming the note still holds.

Where	What was seen	Why it matters to the user
Bursar: payment slip	School bank name and account number were blank ? slip read `Bank Not Set` / `0000000000`	A parent is told to transfer money into an account that does not exist
School settings	No field exists for bank name or account number	The school cannot fix the above without a developer
Parent dashboard	Merely *generating a slip* shows as a "Last payment" with a *Verifying…* badge	A parent may think they have paid when they only have instructions

Where	What was seen	Why it matters to the user
Online payment	Pay online is hidden unless a gateway key is configured *and* the school opts in	No way to pay online, and no explanation why
Result entry	Save and submit once posted to `/entry/undefined` and failed silently while saying "Scores saved."	A teacher loses a whole term's work
Approvals	After final approval the Final Approve button stayed enabled	A result can be approved twice
Result status	Score rows stay `submitted` even after full approval	Anything gating on score status will leak or hide results
Seeded demo data	One person can hold Form Teacher + HOD + Year-group Master for one class	The chain demonstrates the mechanism but not separation of duties
Email	Development mail goes to Mailpit unless Brevo is configured	Nothing reaches a parent
